01

Executive Summary

What we're building and why it wins

Inbox Intelligence is a modular, Gmail-native AI platform that transforms unstructured communication data into structured, actionable intelligence. Rather than a single-purpose tool, it operates as a persistent analysis layer that runs six specialized modules on top of a shared parsing and entity extraction core.

The personal product wins on immediate emotional resonance — every demo surfaces real financial waste, missed commitments, and relationship decay within seconds. The enterprise product wins on defensible moat: the longer a team uses the platform, the richer the entity store and the harder it is to replace.

\$340

independent modules

Core Value Proposition

- Build once, analyze everything. One ingestion pipeline powers six product lines.
- Immediate ROI. The financial scanner alone pays back in the first demo.
- Compounding moat. The entity store grows more valuable over time — churn becomes structurally difficult.
- Enterprise-ready from day one. Each module maps to a recognized enterprise buyer: Finance, Sales, Legal, HR.

02

The Problem Space

Why communication data is the most underutilized asset

SectionIntro

The average knowledge worker sends and receives 121 emails per day. Over a working year that is roughly 30,000 messages — each one containing signals: financial commitments, relationship context, legal obligations, and decision history. None of this is captured. None of it is queryable. It all decays silently in a search index nobody uses.

Financial Blindness

The average person auto-pays \$300+ per month in services they no longer use. Subscription prices change silently. Renewal notices get buried. Nobody audits their inbox for spend.

Commitment Decay

Email creates implicit contracts constantly — 'I'll send that by Friday,' 'let's connect next week.' Research shows 40% of email commitments are never fulfilled. Nobody tracks them.

Relationship Neglect

Professional relationships degrade at a predictable rate. The signal is all there — last contact date, response time trends, conversation frequency — but nobody reads it.

Institutional Amnesia

When someone leaves an organization, the reasoning behind decisions leaves with them. New hires repeat past mistakes. Teams relitigate closed debates. This costs enterprises an estimated \$47M per year per 1,000 employees in lost productivity.

Legal Exposure

Contracts, NDAs, lease renewals, and compliance deadlines live in inboxes with no tracking. The cost of a missed renewal or an overlooked obligation is always higher than the cost of prevention.

03

Platform Architecture

One ingestion layer. Six analysis modules. Infinite scale.

The platform is structured in three tiers: data ingestion, a unified entity store, and a modular analysis layer. All modules read from the same normalized data. Adding a new module does not require changes to the ingestion pipeline.

DATA SOURCES	Gmail Inbox · Google Calendar · Google Drive · Uploaded Documents
INGESTION LAYER	Gmail MCP Connector · Message Batch Fetcher · Attachment Parser · Calendar Event Extractor
PARSING CORE	Claude Message Classifier · Entity Extractor (people / amounts / dates / obligations) · Temporal Indexer · Deduplication Engine
ENTITY STORE	Normalized Message Records · Entity Graph (people + companies + amounts) · Commitment Ledger · Relationship Timeline
MODULE LAYER	Financial Scanner · Relationship Signal · Legal Watcher · Follow-Up Tracker · Institutional Memory · Life & Health Admin
ACTION ENGINE	Priority Surface (ranked urgency list) · Draft Generator · Calendar MCP (auto-schedule) · Alert Dispatcher

Key Architectural Decisions

- **Single ingestion, multiple consumers.** The Gmail MCP fetch and parsing pipeline runs once. Every module consumes the resulting entity store. This eliminates redundant API calls and ensures module outputs are always consistent.
- **Claude as the classification spine.** A single Claude prompt chain handles message classification, entity extraction, and commitment detection simultaneously. The structured JSON output feeds the entity store directly.
- **Modular prompt chains.** Each analysis module is an independent Claude prompt chain that takes entity store records as input and produces ranked, actionable output. Modules can be enabled, disabled, or upgraded independently.
- **Persistent entity store.** The entity store accumulates over time. Relationship graphs deepen. Commitment histories lengthen. Institutional memory grows. This is the compounding moat — the platform becomes more valuable the longer it runs.

04

Module Specifications

Six independent analysis engines on one data foundation

M1 Financial Scanner *Find every dollar you forgot you were spending.*

The Problem

The average household auto-pays \$300+ per month in forgotten or unused subscriptions. Price increases arrive silently. Renewal notices get buried under promotional email. Nobody audits their inbox for financial exposure.

What It Does

- Scans all email for receipt keywords, subscription confirmations, renewal notices, and pricing emails.
- Extracts: vendor name, amount, billing frequency, last payment date, renewal date.
- Classifies each line item as: active-used, active-unused, price-increased, or renewing-soon.
- Generates a recurring spend map sorted by waste potential.
- Drafts a cancellation or negotiation email for any flagged item in one click.

Output: Ranked spend map + cancellation draft queue + renewal calendar entries.

Enterprise Expansion

AP/AR reconciliation engine. Vendor spend analysis by category. Budget drift alerts for finance teams. Duplicate vendor detection across departments. Contract expiry management.

Demo Moment

"This inbox contains \$340/month in recurring charges. Here are the 6 you probably forgot about."

M2 Relationship Signal *Know who matters before you need them.*

The Problem

Professional relationships degrade at a predictable rate that nobody tracks. The signal is all in the inbox — last contact date, response time, conversation depth — but nothing surfaces it until the relationship is already cold.

What It Does

- Builds a relationship graph from all email senders and recipients.
- Tracks: contact frequency, recency, response time trends, conversation depth, life events mentioned.

- Detects relationship decay: important contacts not reached in 30, 60, 90 days.
- Generates pre-meeting briefings: last 3 interactions, open threads, topics they care about.
- Surfaces warm-up opportunities: 'Marcus mentioned a fundraiser 3 months ago — here is a draft check-in.'

Output: Relationship health dashboard + decay alerts + pre-meeting briefings + warm-up drafts.

Enterprise Expansion

Account health scoring for sales teams. Churn risk detection for customer success. Key stakeholder monitoring for executives. Hiring pipeline relationship mapping.

Demo Moment

"You have 3 critical contacts you have not spoken to in over 60 days. Here is a draft for each."

M3 Legal and Contract Watch *Never miss an obligation, deadline, or renewal.*

The Problem

Contracts, NDAs, lease agreements, terms-of-service updates, and demand letters land in inboxes with no tracking. The cost of a missed renewal or unmet obligation is always higher than the cost of monitoring it.

What It Does

- Detects contracts, legal correspondence, compliance notices, and TOS update emails.
- Extracts: parties, key dates, obligations, renewal windows, penalty clauses.
- Generates an obligation calendar: every deadline surfaced with lead-time alerts.
- Flags asymmetric terms: clauses that are non-standard in their category and jurisdiction.
- Drafts response language for demand letters and negotiation correspondence.

Output: Obligation calendar + risk-ranked clause list + deadline alerts + response drafts.

Enterprise Expansion

Contract lifecycle management. Compliance surface for legal and procurement teams. Vendor obligation tracking. Regulatory deadline management.

Demo Moment

"You have 2 contracts renewing in the next 30 days. One has an auto-renew clause you never flagged."

M4 Follow-Up and Commitment Tracker *Close every loop you opened.*

The Problem

Email constantly creates implicit commitments that nobody tracks. Research shows 40% of email commitments go unfulfilled. Every broken thread is a damaged relationship or a missed opportunity.

What It Does

- Identifies every email containing an explicit or implicit commitment: 'I will send,' 'let us reconnect,' 'I will intro you.'
- Tracks fulfillment status: open, fulfilled, or gone cold.
- Surfaces stale commitments ranked by age and relationship importance.
- Detects inbound commitments that others made to you and have not fulfilled.
- Generates follow-up email drafts for any open commitment.

Output: Commitment ledger (outbound + inbound) + stale thread alerts + follow-up draft queue.

Enterprise Expansion

Sales pipeline hygiene. Project commitment tracking. Executive accountability layer. Board and investor follow-up management.

Demo Moment

"23 open commitments. 9 are over 14 days old. Here are the 3 that matter most."

M5 Institutional Memory *Reconstruct the reasoning, not just the record.*

The Problem

Organizations lose institutional knowledge every time someone leaves, every time a project ends without documentation, every time a decision is made in an email thread nobody can find six months later.

What It Does

- Indexes all email threads, Drive documents, and meeting notes into a queryable knowledge base.
- Reconstructs decision trails: who decided, when, what alternatives were considered, what the outcome was.
- Generates new hire context briefs: role-specific background, relevant prior decisions, key contacts.
- Surfaces prior work when a new project starts: 'Your team tried this approach in Q3 2024. Here is what happened.'
- Answers natural language queries across the full history: 'Why do we use vendor X instead of Y?'

Output: Queryable knowledge base + decision trail reconstruction + onboarding briefs + proactive surface.

Enterprise Expansion

Directly replaces tribal knowledge management tools. Competes with Notion AI and Guru but grounded in actual communication history rather than documentation people forgot to write.

Demo Moment

"Why did we stop using that vendor?" — [reconstructs 8-month-old email thread with full reasoning]

M6 Life and Health Admin *No referral missed. No renewal forgotten. No claim lost.*

The Problem

Medical appointment confirmations, prescription renewals, insurance EOBs, referral follow-ups, and benefits documents all land in the same inbox as newsletters and promotional email. Critical health admin falls through the cracks.

What It Does

- Detects health-related email: appointment confirmations, referral letters, prescription renewals, insurance EOBs.
- Surfaces overdue follow-ups: 'Your follow-up with the cardiologist was 6 weeks ago and no results were sent.'
- Tracks insurance claims from submission through resolution.
- Generates appointment summaries and medication schedule reminders.
- For Canadian users: maps to OHIP coverage, identifies covered vs. out-of-pocket expenses.

Output: Health admin dashboard + follow-up alerts + claim tracker + coverage summary.

Enterprise Expansion

HR benefits navigation platform. Employee wellness integration. Insurance claims management for self-insured employers. Occupational health compliance tracking.

Demo Moment

"You have 3 outstanding health follow-ups. One referral was sent 8 weeks ago with no response."

05

Enterprise Go-To-Market

Land, expand, and lock in — with the same product

The enterprise strategy is a classic land-and-expand motion, but with a structural advantage: every module adds value on the same underlying data. You never resell — you deepen. The entity store accumulates over time, creating a switching cost that grows with every day of usage.

Phase 1: Land

- Deploy Financial Scanner for a mid-size company's finance team.
- Demo: vendor spend map surfaced from Gmail in under 10 minutes.
- Pricing: platform fee + Financial Scanner module license.
- Target buyer: CFO, VP Finance, or procurement lead.

Phase 2:
Expand

- Add Relationship Signal for the sales team on the same data layer.
- Add Follow-Up Tracker for executive team — no new integration required.
- Pricing: per-seat module licensing. Each team pays for what they use.
- Target buyer: CRO, VP Sales, Chief of Staff.

Phase 3: Lock
In

- Institutional Memory module activates. Decision history accumulates.
- Entity store is now 12+ months deep. Relationship graph is irreplaceable.
- Switching cost is structural: the data lives here. Churn becomes difficult.
- New hire onboarding, legal compliance, and HR benefits modules expand TAM.

Pricing Model

Tier	Target	Modules	Pricing Model
Personal	Individual users	All 6 (personal scope)	\$19/month
Team	5–50 users	Choose 2–3 modules	\$49/seat/month
Business	50–500 users	All modules, custom prompts	\$99/seat/month
Enterprise	500+ users	Full platform + SLA + SSO	Custom contract

06

Hackathon Demo Script

4 minutes. 3 emotional punches. 1 enterprise pivot.

The demo follows a deliberate arc: start with financial pain (immediate ROI), escalate to relationship pain (personal and professional), close with the enterprise reveal. Every transition should feel inevitable, not scripted.

0:00 — Setup	Open a real (or seeded) Gmail inbox. Show the message count. Say: 'There are 4,200 emails in this inbox. Watch what the platform finds in 30 seconds.'
0:30 — Financial Scanner fires	Module 1 output appears: recurring spend map. Highlight the \$340/month figure. Show 3 subscriptions the user has not used in 60+ days. Click one — the cancellation email draft appears instantly. Pause here. Let the number land.
1:15 — Follow-Up Tracker fires	Module 4 output: 23 open commitments. Show the oldest one — a 3-week-old 'I will send you that intro' that never happened. Show the follow-up draft. Say: 'This is real. This is your actual inbox.'
2:00 — Relationship Signal fires	Module 2: three critical contacts with 60+ day decay. One is a potential investor. Click — a personalized warm-up email draft, referencing their last conversation topic. This is the moment the audience realizes the platform knows their relationships.
2:45 — The Enterprise Pivot	Hard cut to a slide: 'Now imagine this running on a 200-person sales org.' Show the relationship signal output reframed as account health scoring. Show the follow-up tracker reframed as pipeline hygiene. Same engine. Same data layer. Enterprise price point.
3:30 — Close	'We built the ingestion layer once. Every module is a product line. The longer you run it, the more valuable it gets. That is the moat.' End on the pricing tier slide.

Critical Demo Rule

Seed the demo Gmail account with real-looking data before the presentation. Use an account with 3 planted subscriptions, 5 planted commitment emails, and 2 planted relationship decay contacts. Never demo on a live personal inbox in front of judges — the risk of surfacing something private is not worth it.

07

Technical Stack

What to build, in what order, with what tools

Layer	Technology	Purpose	Build Priority
Data Ingestion	Gmail MCP + Google Calendar MCP	Fetch messages, threads, events	Day 1 — first
Message Parsing	Claude claude-sonnet-4-20250514 (classTag)	Extract entities, detect commitments	Day 1 — second
Entity Store	SQLite (hackathon) / PostgreSQL (prod)	Store normalized records, relationships	Day 1 — third
Module: Financial	Claude prompt chain + regex amount extractor	Spread map, renewal detection	Day 1 — demo-ready
Module: Follow-Up	Claude commitment detector prompt	Open loop identification	Day 1 — demo-ready
Module: Relationship	Graph traversal + Claude briefing generator	Decay detection, warm-up drafts	Day 2
Module: Legal	Claude contract classifier + date extractor	Obligation calendar, risk flags	Day 2
Module: Memory	Embedding store (pgvector / Chroma) + RAG	Semantic search over history	Post-hackathon
Action Engine	Calendar MCP + draft generator	Auto-schedule, email drafts	Day 2
Frontend	React + Tailwind	Dashboard, module outputs, draft UI	Day 2

Claude Classifier Prompt Structure

The core parsing prompt runs on each message batch and returns a structured JSON object. This is the data contract between the ingestion layer and all modules:

```

{
  "message_id": "string",
  "classification": ["financial" | "relationship" | "legal" | "commitment" | "health" | "noise"],
  "entities": {
    "people": [{"name": "string", "email": "string", "role": "string"}],
    "companies": [{"name": "string", "relationship": "vendor|client|partner"}],
    "amounts": [{"value": float, "currency": "string", "context": "subscription|invoice|salary"}],
    "dates": [{"date": "ISO-8601", "type": "deadline|renewal|appointment|commitment"}]
  },
  "commitments": [
    {
      "type": "outbound|inbound",
      "description": "string",
      "owner": "string",
      "due": "ISO-8601 or null",
      "fulfilled": boolean
    }
  ],
  "urgency_score": 0-10,
  "summary": "string (1 sentence)"
}

```

08

Roadmap

Hackathon → Beta → Enterprise in 12 months

Hackathon (48 hrs)

Gmail MCP ingestion + message batch fetch · Claude classifier + entity extractor (core prompt) · SQLite entity store · Financial Scanner — fully demo-ready

Follow-Up Tracker — fully demo-ready · Basic React dashboard · Calendar MCP — appointment creation

Beta (Month 1–3)

Relationship Signal module · Legal and Contract Watch module · Outlook connector (expand beyond Gmail) · User authentication + multi-account support

Email draft send integration · Mobile-responsive dashboard · Waitlist + early access onboarding

V1 Enterprise (Month 4–8)

Institutional Memory module (embedding store + RAG) · Life and Health Admin module · Team/org mode — shared entity stores · Role-based module access

Slack connector for commitment detection · Google Drive ingestion for Institutional Memory · SOC 2 Type I compliance

Scale (Month 9–12)

Enterprise SSO (SAML/OIDC) · API access for third-party integrations · Custom prompt tuning per enterprise client · Salesforce and HubSpot CRM sync

Advanced analytics dashboard for admins · SOC 2 Type II + GDPR compliance

09

Competitive Landscape

Why nothing else does what this does

Existing tools solve one layer of the problem. None of them share a data foundation across multiple analysis types, and none of them accumulate a compounding entity store that grows more valuable over time.

Competitor	What They Do	What They Miss	Our Advantage
Superhuman	Fast email client with AI triage	No financial, legal, or relationship analysis	Six analysis modules, not just triage
Notion AI	Knowledge base with AI search	No email ingestion, no real-time signal	Grounded in live communication data
Salesforce Einstein	CRM relationship intelligence	Only works for sales, requires CRM data entry	Automatic, works on raw email
Trim / Rocket Money	Subscription cancellation	Consumer-only, no email parsing, no models	Business-native, enterprise-ready
Guru / Tettra	Internal knowledge management	Requires manual documentation, no email	Auto-extracts from communication history
Calendly / x.ai	Scheduling automation	No relationship, financial, or legal layer	One platform for all communication intelligence

The Structural Moat in One Sentence

Every competitor solves one problem on top of data they do not own. We solve six problems on top of data that accumulates in our entity store — and the longer a customer stays, the more irreplaceable we become.

Each module is implemented as a focused Claude prompt chain. The classifier runs first on every message batch. Module-specific prompts then consume the structured output. Below are the prompt patterns for each module.

Core Classifier Prompt Pattern

System: You are a communication intelligence classifier. Extract all structured signals from this email.

Input: Raw email (subject, sender, body, timestamp)

Output: JSON matching the entity schema (message_id, classification[], entities{}, commitments[], urgency_score, summary)

Constraint: Return ONLY valid JSON. No preamble. No explanation.

Financial Scanner Prompt Pattern

System: You are a financial intelligence analyst. Analyze this set of tagged financial emails.

Input: Array of financial-classified entity records from the entity store

Output: JSON array of spend items (vendor, amount, frequency, last_seen, renewal_date, usage_signal, waste_score 0-10)

Constraint: Infer usage signal from email recency and engagement. Flag items not seen in 60+ days.

Commitment Detector Prompt Pattern

System: You are a commitment tracking assistant. Identify every promise made or received in this email.

Input: Email body + sender + recipient + date

Output: JSON array of commitments (owner, description, due_date, type: outbound|inbound, fulfilled: false)

Constraint: Flag implicit commitments ('let us connect soon') as well as explicit ones.

Relationship Signal Prompt Pattern

System: You are a relationship intelligence assistant. Analyze the communication history for this contact.

Input: Array of email records with this contact (last 90 days), sorted by date

Output: JSON (contact_name, last_contact, frequency_trend, relationship_score 0-10, topics[], suggested_action, draft_subject)

Constraint: Detect decay if frequency_trend is declining AND last_contact > 30 days.

Institutional Memory Query Pattern

System: You are an institutional memory retrieval assistant. Reconstruct the decision trail for this query.

Input: User query + retrieved email chunks (top-k RAG results) + metadata (dates, senders, thread IDs)

Output: Narrative reconstruction with: decision made, who decided, alternatives considered, outcome, related threads

Constraint: Cite specific emails by date and sender. Flag gaps in the record explicitly.
